CANDY MONSTER

iGaming Cash-Out Game · Original Concept

Nathan Collard · Game Designer · Kaching Originals

Version 1.1 · 2026

1. Executive Summary

Candy Monster is an iGaming game in the crash/escalation genre, built around feeding candy to a cartoon monster named Glouf. Each candy fed increases the active multiplier. The player can cash out at any time. If Glouf refuses or vomits the candy, the round ends and the player loses their bet.

The math is a constant-RTP cash-out ladder: the multipliers are set first, and each bust chance is derived from the displayed multiplier, so cashing out at any step returns exactly 98.0% on average. The ladder is benchmarked on Stake's Chicken (same 98% ladder, same ×181,060.88 top multiplier); the originality lies in the theme, the character and the feedback design. The candy-and-monster theme gives this ladder an expressive, animation-rich character whose visible reactions communicate game state at a glance, alongside the explicit odds shown in the ladder tooltips and the odds table.

Format: Single-screen HTML5 game · Mobile-first · Cash-out mechanic

RTP: 98.0% across all difficulty modes (exact at every tier)

Bets: from €0.20. Payouts are not rounded: they are credited to 8 decimal places, as on crypto casinos, so the RTP is exactly 98% at every bet size.

Genre: Crash / Escalation — player-controlled risk depth

Character: "Glouf" — round green blob monster

Max win: ×181 060.88 (Expert mode, 10th candy)

2. Core Concept & Theme

2.1 Concept

The player feeds candy to Glouf one piece at a time. After each successful feeding, the multiplier updates and the player chooses: feed again (risk more) or cash out (secure gains). The monster's progressively uncomfortable animations provide an implicit, charming risk meter.

When the maximum step for the selected mode is reached, the game automatically cashes out at the maximum multiplier — Glouf has eaten too much and can't take any more.

2.2 Character — Glouf

- Body: round blob, green gradient, belly expands slightly with each candy consumed
- Eyes: large, expressive — pupils drop to the candy as the mouth opens, random idle blink and look-around
- Idle: gentle bounce, random gaze direction (left/right/up), blink every 3–6 seconds
- Eating: wide open mouth with teeth, cheeks blush, crunchy audio — mouth opens as candy approaches
- Warning (after 4 candies eaten): visible sweat drops, furrowed brow — implicit risk signal
- Refuse (bust on the 1st or 2nd candy): Glouf grimaces and looks away, candy bounces back — trombone sound
- Vomit (bust from the 3rd candy): Glouf heaves, then a rainbow stream arcs from his mouth into a puddle, gurgle sound + descending pitch
- Win: golden sparkles, confetti burst, ascending fanfare (4 notes, or 5 notes plus bass from ×5)

2.3 Competitive Positioning

Game	Publisher	Math Model	Candy Monster Differentiator
Chicken	Stake Originals	Identical: same 98% ladder, used as the benchmark	Richer character expression, candy animation arc, vomit vs refuse states
Crash	Multiple	Similar	Physical interaction metaphor, no abstract curve
Plinko	Stake Originals	Different	Player-initiated steps, cash-out agency at each tier

3. Game Mechanics

3.1 Round Flow

- Player selects difficulty and sets bet amount
- Click "Nourrir": bet deducted, bust probability rolled for this step
- If bust: Glouf refuses (early steps) or vomits (later steps) — round ends, bet lost
- If survive: candy animation plays, Glouf opens mouth, multiplier updates
- Player chooses: "Nourrir encore" (risk) or "Cash Out" (collect current multiplier × bet)
- If maximum step reached: automatic cash-out at the mode's maximum multiplier

3.2 Bust States

State	Trigger Condition	Animation	Sound Effect
Refuse	Bust on the 1st or 2nd candy	Glouf grimaces and looks away, candy bounces back toward player	Descending sawtooth — trombone wah
Vomit	Bust from the 3rd candy	Glouf heaves (cheeks puff, body shakes), then a six-band rainbow stream arcs from his mouth into a puddle, with 46 rainbow droplets	Glissando 450→60 Hz + lowpass noise gurgle

3.3 Multiplier Ladder UI

A horizontal strip below Glouf shows upcoming multiplier tiers as a sliding window. Each slot displays a mini wrapped-candy icon (checked off when passed) and the multiplier value. On desktop, hovering a tier with the mouse shows two probability figures (example: Facile, tier 5):

- "Chance from the start: 73.7%" — cumulative probability of reaching this tier from a fresh bet
- "Chance to clear this step: 93.2%" — conditional probability of surviving this specific step

This two-layer information model supports player trust: it distinguishes "overall odds" from "current odds" transparently. On touch screens the tooltips are disabled, since a tap cannot end a hover cleanly.

4. Mathematical Model — Constant-RTP Ladder

Multipliers are set first; each bust chance is derived from the displayed multiplier so that every tier returns exactly 98%: survival(n) = 0.98 ÷ multiplier(n), bust(n) = 1 − survival(n) ÷ survival(n−1). Cashing out at any tier therefore returns exactly 98.0% in expectation, whatever the mode or the stopping strategy.

4.1 Facile 😄 — 19 tiers, RTP 98.0%

Step	Multiplier	Cumul. Win %	Bust % (conditional)
1	×1.03	95.1%	4.85%
2	×1.09	89.9%	5.50%
3	×1.16	84.5%	6.03%
5	×1.33	73.7%	6.77%
10	×1.96	50.0%	8.67%
15	×3.92	25.0%	16.58%
19 (MAX)	×19.60	5.0%	50.00%

4.2 Moyen 🙂 — 17 tiers, RTP 98.0%

Step	Multiplier	Cumul. Win %	Bust % (conditional)
1	×1.15	85.2%	14.78%
3	×1.64	59.8%	16.46%
5	×2.46	39.8%	18.70%
10	×9.31	10.5%	27.28%
17 (MAX)	×1 117.20	0.088%	75.00%

4.3 Difficile 😵 — 15 tiers, RTP 98.0%

Step	Multiplier	Cumul. Win %	Bust % (conditional)
1	×1.31	74.8%	25.19%
3	×2.46	39.8%	28.05%
5	×5.06	19.4%	31.23%
10	×60.29	1.6%	45.45%
15 (MAX)	×15 193.92	0.0064%	83.33%

4.4 Expert 😈 — 10 tiers, RTP 98.0%

Step	Multiplier	Cumul. Win %	Bust % (conditional)
1	×1.96	50.0%	50.00%
2	×4.14	23.7%	52.66%
5	×60.29	1.6%	62.50%
8	×2 743.35	0.036%	76.92%
10 (MAX)	×181 060.88	0.0005%	90.91%

4.5 Mode Summary

Mode	Tiers	Max Multiplier	1st Bust Prob.	RTP
Facile 😄	19	×19.60	4.85%	98.0%
Moyen 🙂	17	×1 117	14.78%	98.0%
Difficile 🧐	15	×15 194	25.19%	98.0%
Expert 😈	10	×181 061	50%	98.0%

5. Audio Design

Event	Description
Candy arrive (nom)	Recorded crunch sample (free-licence sound library), slight random pitch so repeats never sound identical
Bust — Refuse	Sawtooth oscillator 300→150 Hz — trombone descending wah
Bust — Vomit	Sawtooth 450→60 Hz glissando + lowpass noise gurgle layer
Win — Cash Out	4–5 note ascending arpeggio (sine/triangle), bass thud if mult ≥5

6. Technical Specifications

Specification	Value
Technology	HTML5 · Canvas 2D · Web Audio API
Dependencies	No libraries; one HTML file plus the site's shared scripts and one sound sample
File size	~60 KB (HTML), ~77 KB with scripts and sound
Platform	Desktop · Mobile · Tablet (responsive)
Math model	Constant-RTP ladder: survival = 0.98 ÷ displayed multiplier
RNG	Math.random() prototype — replaceable with certified backend
Animation	requestAnimationFrame loop, timings tuned for 60 Hz screens

7. Commercial Roadmap

- Backend RNG integration with certified provider
- GLI/BMM certification of the math model
- Glouf alternate skin variants per operator branding
- Daily candy bonus (free round per day — retention mechanic)
- Leaderboard: highest multiplier of the day/week
- Consecutive feed streaks tracked for bonus unlock
- RGS integration for multi-operator deployment
- Localization: FR / EN live; DE / ES / PT / JP on the roadmap
